## Analytical Standards for Cannabis Testing

The legalization of cannabis, for both medicinal and recreational purposes, has been gaining speed, yet legislation and regulation have not necessarily kept pace. Even so, out of a drive for self-regulation and significant consumer safety concerns, many producers and manufacturers are turning to testing labs in order to ensure that their products are high quality and free of chemical contaminants. Spex CertiPrep offers ISO 17034 Certified Reference Materials (CRMs) for all of the common contaminants such as pesticide residues, residual solvents and heavy metals, as well as qualitative analysis CRMs such as terpenes. As the industry demands change and regulations are put into place, we continually update our product offerings.

Designed for methods: state specific pesticide regulations: OAR 333-008-11, HB 3460, AOAC 2007.01, EN 15662.

## AOAC Pesticide Standards

AOAC International started as the Association of Official Agricultural Chemists over a century ago and continues to serve as one of the primary method and standard developers for the analytical community when it comes to the area of agriculture. Their activities cover the safety of food and beverages, dietary supplements, feeds, soil, water, veterinary drugs, and other aspects of the agricultural process. Over the last few years, AOAC has issued guidance for screening pesticides in cannabis. Spex CertiPrep AOAC standards reflect the list of pesticides under scrutiny for cannabis testing.

# Flavonoid Standards and Compound Mix

Flavonoids are naturally occurring secondary metabolic products that can have important functions within plants and benefit consumers with health and healing properties. Similar to terpenes, flavonoids share a role in how we perceive cannabis through our senses. Flavonoids are not unique to the cannabis plant. They have been identified in nature, from flowers to fruits and vegetables. Researchers have started to investigate the potential therapeutic properties of individual cannabis flavonoids.

Many beneficial compounds are metabolites produced as an end product of chemical and biological processes. Metabolites are small molecules that have many functions including defense, pigments, pheromones, odorants, and catalysts. Primary metabolites are necessary for growth, development and reproduction. Flavonoids are secondary plant, algae or fungus metabolites composed of polyphenolic compounds. Secondary metabolites are not directly involved in critical processes but have secondary functions involving defense and pigmentation. We offer analytical standards for flavonoid analysis.

# Mycotoxins

Mold and fungi are all over the world and are of major concern in agricultural products. Fungi and their spores can spread throughout crops and food stores tainting crops. Fungi can proliferate into colonies with the right environmental conditions which destroy crops by consuming them or poison them with toxic secondary metabolites called mycotoxins.

Spex CertiPrep offers an analytical standard mix of five of the most commonly tested mycotoxins (four aflatoxins and ochratoxin A) for your mycotoxin testing needs. Our mycotoxins are ISO 17034 accredited. Custom standards are also available.

# Heavy Metal Standards for Cannabis Testing

States are pushing for the cannabis industry to provide accurate, quantifiable results for heavy metals, specifically arsenic, cadmium, lead, and mercury for cannabis inhalation products and cannabis goods (i.e. edibles). California and Colorado have mandated the testing of cannabis for dangerous elemental impurities. The procedure focuses on the use of ICP-MS instrumentation, along with accurate ICP-MS standards, and allows for increased efficiency and accuracy of the analysis necessary to comply with the new state regulations.

Our extensive experience in creating quality trace metal standards, coupled with our ICP-MS analysis, will ensure your company will remain compliant with the new and changing regulations.

Inhalants are a well proven method for drug delivery first reported in the early 20th century. Inhalation therapy has become a mainstay in respiratory care since the inhaled drugs are localized to the target organs, which is not the case in injectable therapies. Since inhaled compounds are concentrated in the target organs, it also means that any contaminants are also concentrated in the lungs as well.
